                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus
DOMAIN: COMPOSED OF THREE STRUCTURAL DOMAINS: A LARGE GLOBULAR TERMINAL DOMAIN WHICH IS RESPONSIBLE FOR THE MOTOR ACTIVITY OF KINESIN (IT HYDROLYZES ATP AND BINDS MICROTUBULE), A CENTRAL ALPHA-HELICAL COILED COIL DOMAIN THAT MEDIATES THE HEAVY CHAIN DIMERIZATION; AND A SMALL GLOBULAR C-TERMINAL DOMAIN WHICH
                                                                                          C. Natl. Acad. Sci. U.S.A. 91:3744-3748 (1994).
FUNCTION: KINESIN IS A MICROTUBULE-ASSOCIATED FORCE-PRODUCING PROTEIN THAT MAY PLAY A ROLE IN ORGANELLE TRANSPORT. MAY BE INVOLVED IN THE MECHANISMS OF GROWTH ARREST INDUCED BY EXPOSUIDNA-DAMAGING DRUGS OR BY CELLULAR SENESCENCE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LYPSTLVRTEPREHLLDQLKRKQPELLMMLNCSENNKEETI 974

-I- MISCELLANBOUS: MUTANT FILES DISPLAY IMPAIRED ACTION POTENTIAL PROPAGATION AND NEUROTRANSMITTER RELEASE AT NEUROMUSCULAR JUNCTIONS, BUT ARE STILL CAPABLE OF TRANSPORTING CERTAIN MEMBRANES, INCLUDING SYNAPTIC VESICLES, TO THE NERVE TERMINAL.

-I- SIMILARITY: BELONGS TO THE KINESIN-LIKE PROTEIN FAMILY. KINESIN SUBFAMILY.

        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BB
